CHAI & CODE

Web Development — Project 03

1. Project Overview

Chai & Code is a modern editorial-style blogging website created as part of Web Development Project 03. The project focuses on building a responsive multi-page website using HTML5 and CSS3 while maintaining a consistent user experience across all pages. The website reflects a personal developer brand and provides visitors with valuable insights about web development, design thinking, productivity, and creative coding practices. The platform is designed around simplicity, readability, and visual comfort. Visitors can discover the author's background on the Home page, explore blog posts through the Journal section, and communicate directly through the Say Hi page. The project demonstrates practical implementation of responsive layouts, reusable styling systems, and professional website organization suitable for deployment on modern hosting platforms.

2. Business / Website Concept

Chai & Code represents a personal developer blog focused on sharing experiences, lessons learned, and practical guidance related to website development and design. The brand combines technical knowledge, personal storytelling, minimalist design, and professional communication. The website helps build an online presence, showcase communication skills, share technical knowledge, create networking opportunities, and provide a professional contact channel.

3. Project Objectives

Design and develop a complete multi-page website. Demonstrate semantic HTML structure. Apply reusable CSS styling across multiple pages. Build responsive layouts using Flexbox and CSS Grid. Establish a clear visual hierarchy and prepare the project for deployment.

5. Main Functionalities

Consistent branding, multi-page navigation, call-to-action buttons, interactive blog cards, contact form UI, responsive behaviour, and accessibility support.

6. CSS Implementation

The CSS architecture follows a scalable structure whereby reusable classes, variables, and layout utilities minimise duplication throughout the project. Key practices include global reset styling, CSS custom variables, responsive typography using clamp(), Flexbox, CSS Grid, hover transitions, shadows, border-radius styling, and media queries.

7. Responsive Design

Desktop layouts provide multi-column sections and full navigation. Tablet layouts reduce spacing and simplify content structure. Mobile layouts stack content vertically, provide larger touch targets, remove horizontal scrolling, and improve readability.

8. Technology Stack

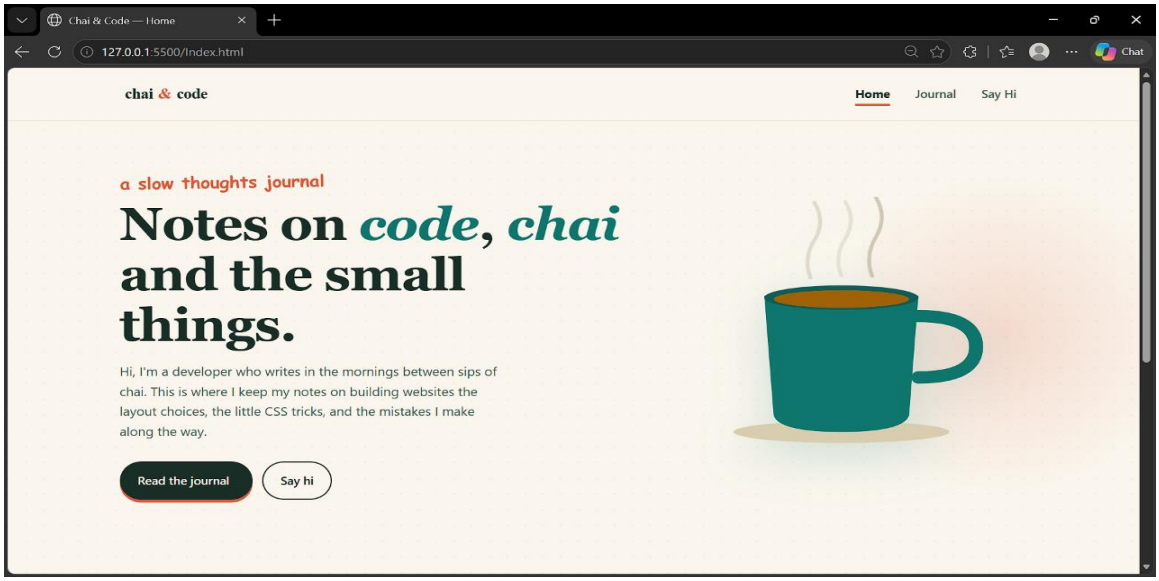

HTML5, CSS3, Flexbox, CSS Grid, Google Fonts, Font Awesome, Unsplash, GitHub, and Netlify/Vercel.

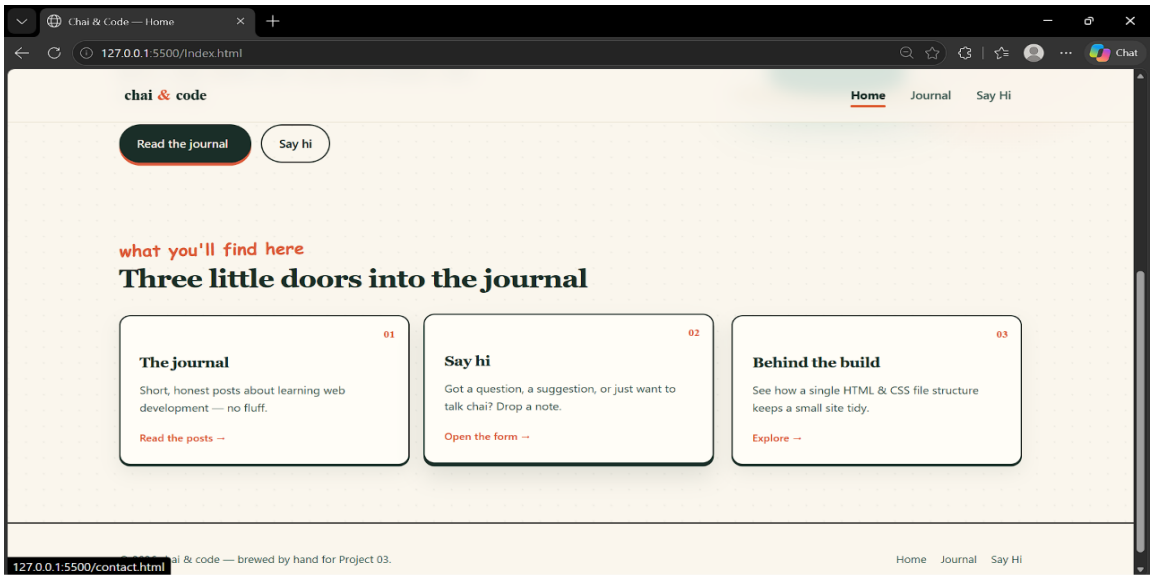

13. Lighthouse and Performance

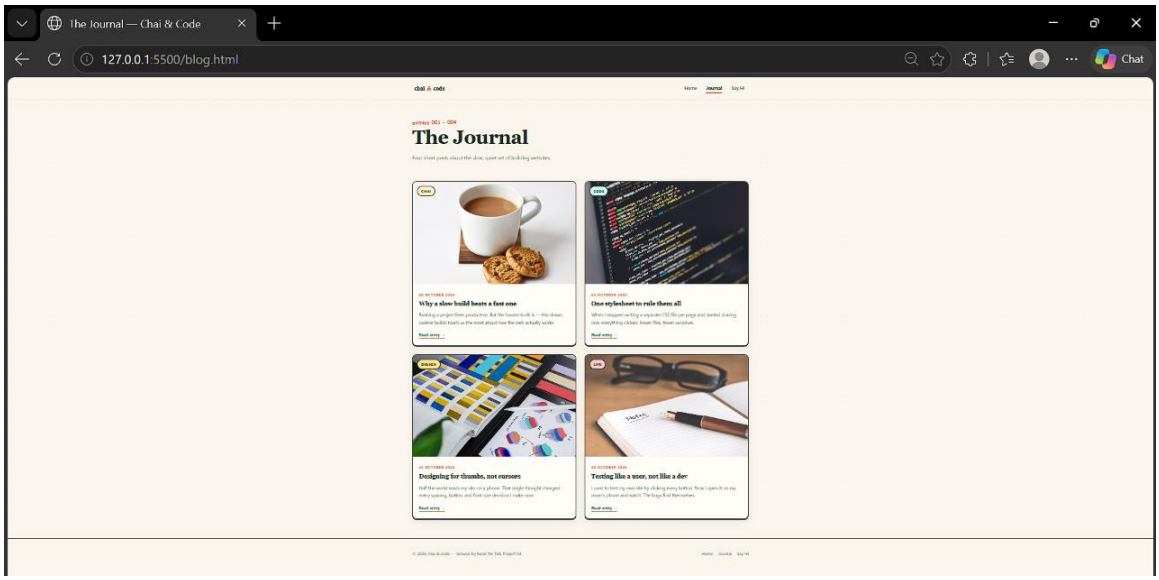

The website should be evaluated through Lighthouse using Performance, Accessibility, Best Practices, and SEO categories. Recommended targets include 80+ Performance and 90+ for Accessibility, Best Practices, and SEO. Optimisation techniques include compressed images, reduced unused CSS, modern font loading, and clean semantic markup.

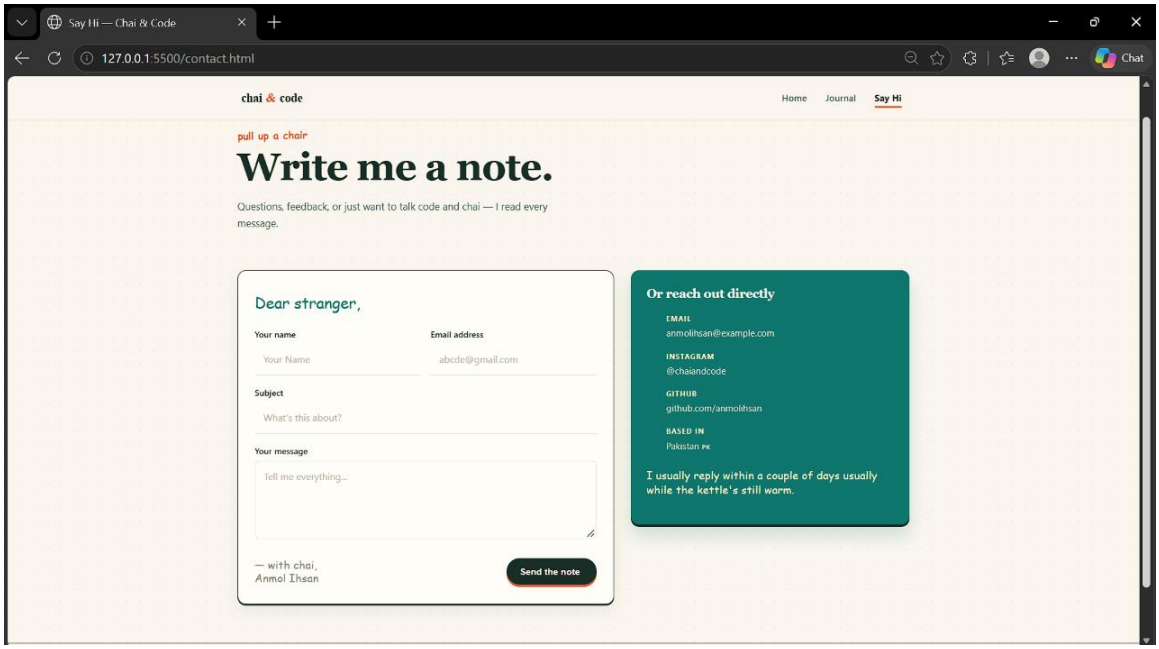

17. Final Project Summary

Chai & Code successfully demonstrates the creation of a professional multi-page blogging website using HTML5 and CSS3. The project showcases responsive design principles, reusable styling architecture, intuitive navigation, organised file management, and modern user interface design practices. The solution is prepared for GitHub version control, Lighthouse evaluation, static hosting, and future scalability
